

MarketMind AI – Automated Stock Market Monitoring and Alert System Using n8n

Problem Statement

The stock market generates a large volume of information every day, including stock price changes, market trends, company announcements, and financial news. Investors and traders often find it difficult to monitor these updates continuously because market conditions can change rapidly within a short period of time. Missing important updates may lead to delayed decisions and potential financial losses.

Most individual investors rely on manually checking multiple websites, financial portals, and mobile applications to stay informed about market movements. This process is time-consuming, repetitive, and inefficient, especially when updates are required frequently throughout the trading day. As the amount of financial data increases, manually tracking stock information becomes increasingly challenging.

To address this issue, there is a need for an automated system that can collect stock market information at regular intervals, process the data, and deliver important updates directly to users without requiring manual intervention. Such a system should provide timely notifications, reduce the effort involved in monitoring the market, and help users stay informed about significant changes in stock prices and market conditions.

The proposed system, **MarketMind AI**, aims to automate the process of monitoring stock market data using workflow automation tools. The system periodically retrieves stock information from financial data sources, processes the collected data, and sends real-time updates to users through messaging platforms such as Telegram. By automating data collection and notification delivery, the system helps investors receive timely market insights and supports better decision-making.

Objective

1. To automate the collection of stock market data at regular intervals.
2. To reduce the need for manual monitoring of financial websites and applications.
3. To provide timely stock market updates to users through Telegram notifications.
4. To improve accessibility to market information using workflow automation.
